Problem

The company was looking for a shared storage solution to cut high licensing costs and achieve redundancy.

Solution

With StarWind vSAN, the company creates an HA cluster, prevents high downtime costs, and builds a high-performance and fault-tolerant IT infrastructure.

DAZN Group saves over 30,000 euros on its IT operational expenses by deploying a high availability (HA) cluster powered by StarWind vSAN

Problem

Before StarWind Virtual SAN (vSAN) deployment, **DAZN Group** had a non-redundant VMware vSphere single host. The company was looking for a virtualized shared storage solution to ensure redundancy. Licensing costs of VMware vSAN were judged prohibitive, so DAZN Group opted for a robust and customizable alternative from StarWind.

Solution

DAZN Group has chosen **StarWind vSAN** because of its clinking good price-performance ratio. StarWind vSAN provided a software-based abstraction layer over the company's node storage and made its cluster highly available (HA). Turning to StarWind, DAZN Group ensured the needed redundancy and saved over 30,000 euros of its IT money budget.

Our VMware vSphere cluster provided by StarWind vSAN has been working like charm since day 1 and prevented downtime during node maintenance and failover.
